

## What happens to my fingerprint?

The fingerprint feature is designed to uniquely identify each person, in turn protecting each individual's identity.

Its very existence on the device is so it **CANNOT** be copied or used for any other purpose by anyone else. The device is designed to take a template of each fingerprint.

It **DOES NOT** store an image nor does it store enough information for it to be possible to copy the fingerprint. On top of this, the template is encrypted so it is completely secure.

The below graphic illustrates how the template is stored.

- It cannot be extracted or used for any purpose
- It cannot be re-engineered
- It cannot be used by anyone for any other purpose
- It can only be used to identify you
